

MELAKUKAN PREDIKSI DATASET MENGGUNAKAN PERBANDINGAN ALGORITMA MLP DAN RANDOM FOREST

GO

TAMPILAN

The screenshot shows a dark-themed web application titled "Deep Learning Portofolio". At the top left, there is a small header section with the text "Deep Learning Portofolio". Below this, the name "MUHAMMAD REINALDY SANTOSO ALARATTE" is displayed. The main title of the application is "Melakukan Prediksi Dataset menggunakan perbandingan Algoritma MLP dan Random Forest", which is centered on the page in large white text. Below the title, there is a descriptive text: "Upload file CSV kamu dan lihat preview datanya secara cepat." At the bottom left, there is a button labeled "Upload Data Set". The right side of the screen features a vertical scroll bar, indicating that the content continues beyond what is visible in the current view.

Hasil Algoritma Random Forest

Kesimpulan

Hasil evaluasi menunjukkan MSE train 4.3439 dan MSE test 29.9955 (RMSE test 5.4768). Selisih error sebesar 590.5% mengindikasikan bahwa Model cenderung overfitting atau belum stabil..

Dari hasil perhitungan feature importance, variabel yang paling berpengaruh dalam prediksi adalah 'air_temp'. Hal ini menunjukkan bahwa variabel tersebut memiliki kontribusi terbesar terhadap target yang diprediksi.

Secara keseluruhan, Random Forest mampu menangkap pola non-linear pada data cuaca dan memberikan hasil prediksi yang cukup akurat. Performa dapat ditingkatkan dengan tuning jumlah tree, max_depth, atau penyesuaian sampling data.

Ringkasan Hasil MLP & Random Forest

- MSE test: **29.9955**
- RMSE train: **2.0842**
- RMSE test: **5.4768**
- Fitur paling berpengaruh (RF): **air_temp**

Hasil evaluasi menunjukkan MSE train 4.3439 dan MSE test 29.9955 (RMSE test 5.4768). Selisih error sebesar 590.5% mengindikasikan bahwa Model cenderung overfitting atau belum stabil..

Dari hasil perhitungan feature importance, variabel yang paling berpengaruh dalam prediksi adalah 'air_temp'. Hal ini menunjukkan bahwa variabel tersebut memiliki kontribusi terbesar terhadap target yang diprediksi.

Secara keseluruhan, Random Forest mampu menangkap pola non-linear pada data cuaca dan memberikan hasil prediksi yang cukup akurat. Performa dapat ditingkatkan dengan tuning jumlah tree, max_depth, atau penyesuaian sampling data.

Perbandingan MLP vs Random Forest

Pada dataset ini, Random Forest menghasilkan nilai MSE test yang lebih kecil dibandingkan MLP, sehingga secara umum Random Forest memberikan performa prediksi yang lebih baik.

Secara umum, perbandingan error (MSE/ RMSE) dan karakteristik model ini dapat dijadikan dasar untuk menjelaskan ke dosen mana algoritma yang lebih sesuai untuk kasus prediksi kelembapan udara pada dataset cuaca yang digunakan, serta bagaimana trade-off antara kompleksitas model dan akurasi.
